

WINDOWS ALARM POP-UP

The ZONITH Windows Alarm Pop-Up allows the immediate mass-notification of alarms on any LAN connected PC on or off-site. The alarm notification will pop-up on the PC screen automatically, overriding any other document or task being worked on at the time the alarm is raised. This module connects to the Alarm Control System (ACS), receiving alarms from fire panels, building management systems, evacuation systems, etc.

The purpose of this module is to notify employees of an alarm immediately and efficiently. It can be used in the case of one security guard working in a control room receiving intruder alerts, or hundreds of PC's on a University campus receiving evacuation procedures. The alarm criticality can be defined in the Zonith ACS, so only certain high priority alarms are dispatched via this module.

Colours, fonts and logos are fully configurable to suit the end-user, and the graphical display is easy to use and understand. Typical industries suited to this product are education, healthcare and psychiatry, correctional facilities, municipalities, etc.

Alarm Sources - Fire, BMS,
Panic, etc.

Alarm Control System
